

# Another Text Editor (ATE)

## Quick Start Guide

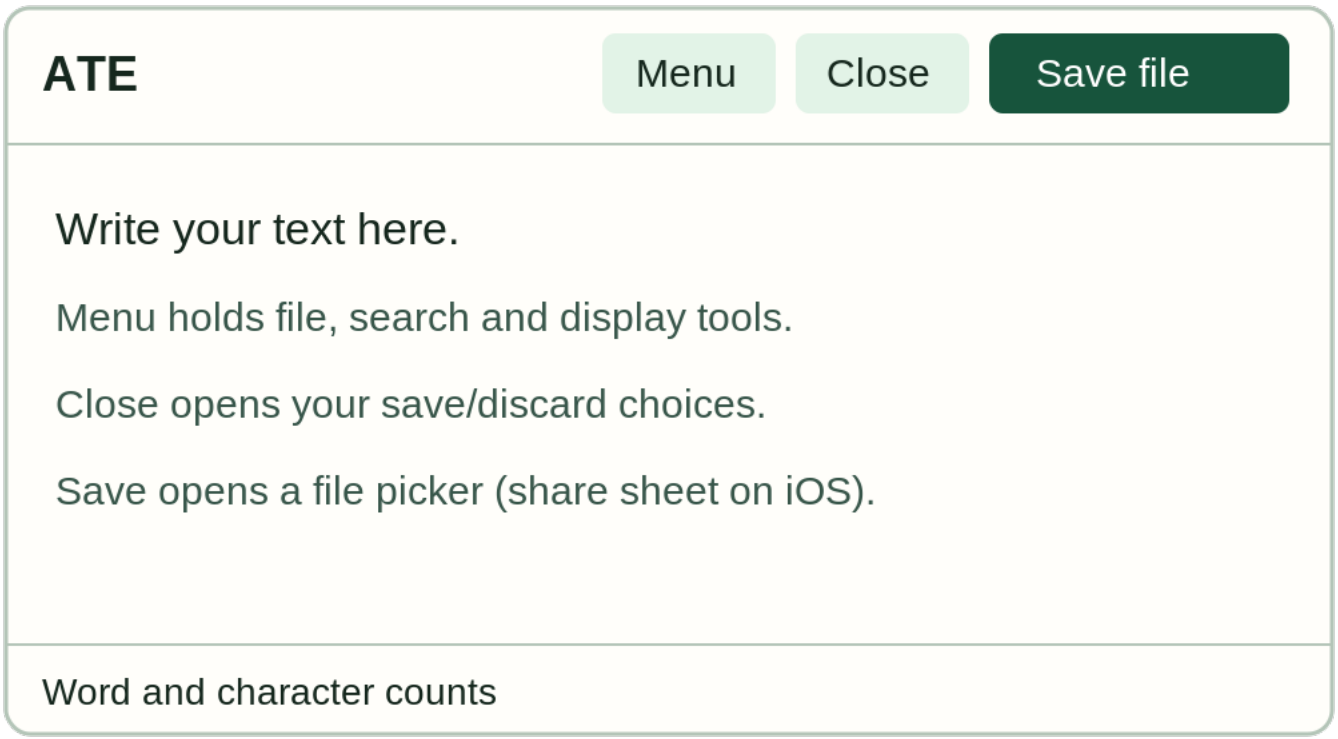

Updated 12 November 2026

Large print · Mobile and desktop edition

iPhone/iPad and universal Mac require a TestFlight invitation. Android APK and the unsigned Windows x64 installer are on Cuberoot. The signed, notarized universal Mac installer is also available.

Current downloads and online guides: www.cuberoot-systems.com/ate/

# Your editor controls

Mobile editor controls; desktop uses Exit and a native Save dialog.

## 1. Get ATE

ATE means **Another Text Editor**. It is a simple full-screen text and code editor. No account or sign-in is required.

• **Android:** download the signed APK from the ATE page on Cuberoot. Open the downloaded file and follow Android’s installation prompts. If asked, allow your browser or Files app to install this file; you can turn that permission off afterwards.

• **iPhone/iPad:** ATE is in TestFlight. Accept your invitation, open TestFlight and tap Install or Update. It is not yet an App Store release.

• **Windows:** download the Windows x64 installer from Cuberoot, open it and follow the setup prompts. It installs for your Windows account. The Windows installer is unsigned, so Windows may show an unknown-publisher warning.

• **Mac:** native Mac TestFlight is available for Intel and Apple silicon. Accept the invitation in TestFlight on your Mac. The signed and notarized universal Mac installer is also available from Cuberoot.

## 2. Write or open a file

• Open ATE and tap the large editing area to write.

• To open an existing file, tap **Menu > Open** and choose a plain-text file from your device or an available file provider.

• Use **Menu > New** for a blank document. Confirm replacement only after saving anything you need.

# 3. Choose readable text

Tap **Menu**. Use **Text size** or A- / A+ to set the display from **10 to 54 pt**; the default is 27 pt. Choose Light or Dark, and Text or Icons for buttons. These settings change your view, not the contents of your file. Tap **Done** to return.

Menu, search, syntax messages and C configuration use 12 pt text, with headings no larger than 14 pt. Document text size remains independent.

# 4. Save your file

• In Menu, enter a **File name**, such as **notes.txt** or **script.py**. Choose Done.

• Choose **Save file**. On iPhone/iPad, choose **Save to Files** in the share sheet. On Android/Fire, the system file manager opens. Choose a folder, enter the filename and tap Save.

• **Windows/Mac desktop:** the native Save dialog opens. Choose a folder and filename, then Save. Selecting an existing file can replace it after the system confirms.

iPhone/iPad shares a copy. Android and desktop Save write to the chosen destination. Cancelling or failing a

save keeps your text and recovery draft; Save and close/exit waits for a successful write on Android and desktop.

Keep independent file copies. A local recovery draft is not a backup or cloud synchronization.

## 5. Find, replace and copy

**Menu > Search / Replace** opens Find and Replace fields. Use Next or Previous to move between matches. Replace changes one match; Replace all changes the document. Undo mistakes with Ctrl+Z or Command+Z.

For copying the whole document, choose **Menu > Select all**, reopen Menu and choose **Copy**. Paste in your other app. Copy does not remove text.

## 6. Close your document

Tap **Close**, then choose **Keep editing**, **Save and close**, or **Close without saving**. Closing without saving removes the recovery draft and clears the editor; files already saved on the device remain.

**iPhone/iPad:** no extra “Editor closed” page appears. Use the Home gesture to leave the app. **Android:**

Close also leaves the app; Android Back closes an open panel first, or opens the closing choices.

**Windows/Mac desktop:** choose **Exit** for Keep editing, Save and exit, or Exit without saving. The window close button and Mac Quit also open these choices. A confirmed exit closes the application.

## 7. Try Vim only if you want it

With a hardware keyboard, choose **Menu > Editing > Vim**. Press **i** to type and **Esc** or **Ctrl+[** for Normal mode. Type **/word**, press Enter, then **n** for the next match or **N** for the opposite direction. Type **:** in Normal mode for a command. Return to **Standard** for ordinary editing.
